

## How to use TUBE EVAC™

1. Place the tubing in the groove of the tube-evac close to where it exits the skin.
2. With your other hand, hold the tubing firmly between the skin and the tube-evac.

3. Firmly squeeze the tube-evac and pull it towards the collection bulb.
4. Advance other hand as necessary to hold tubing.

5. The tube-evac rolls down the tubing very easily with a small but firm squeeze to evacuate small fibrinous material and or clots to maintain a functioning drain.
